1. Small Molecule Identification in Untargeted Metabolomics

- Challenge in untargeted metabolomics studies: **Identification of the small molecules** present in a biological sample
- LC-MS²** widely used analysis platform: Liquid chromatography (LC) coupled with tandem mass spectrometry (MS²) (Fig. 1)
- Most machine learning approaches for small molecule identification only utilize MS² information [3, 2]
- LC retention times (RT) can improve the small molecule annotation [5, 6]
- Challenges utilizing RT information:** (1) LC-system specific RT measurements and (2) public RT databases are limited in size and coverage

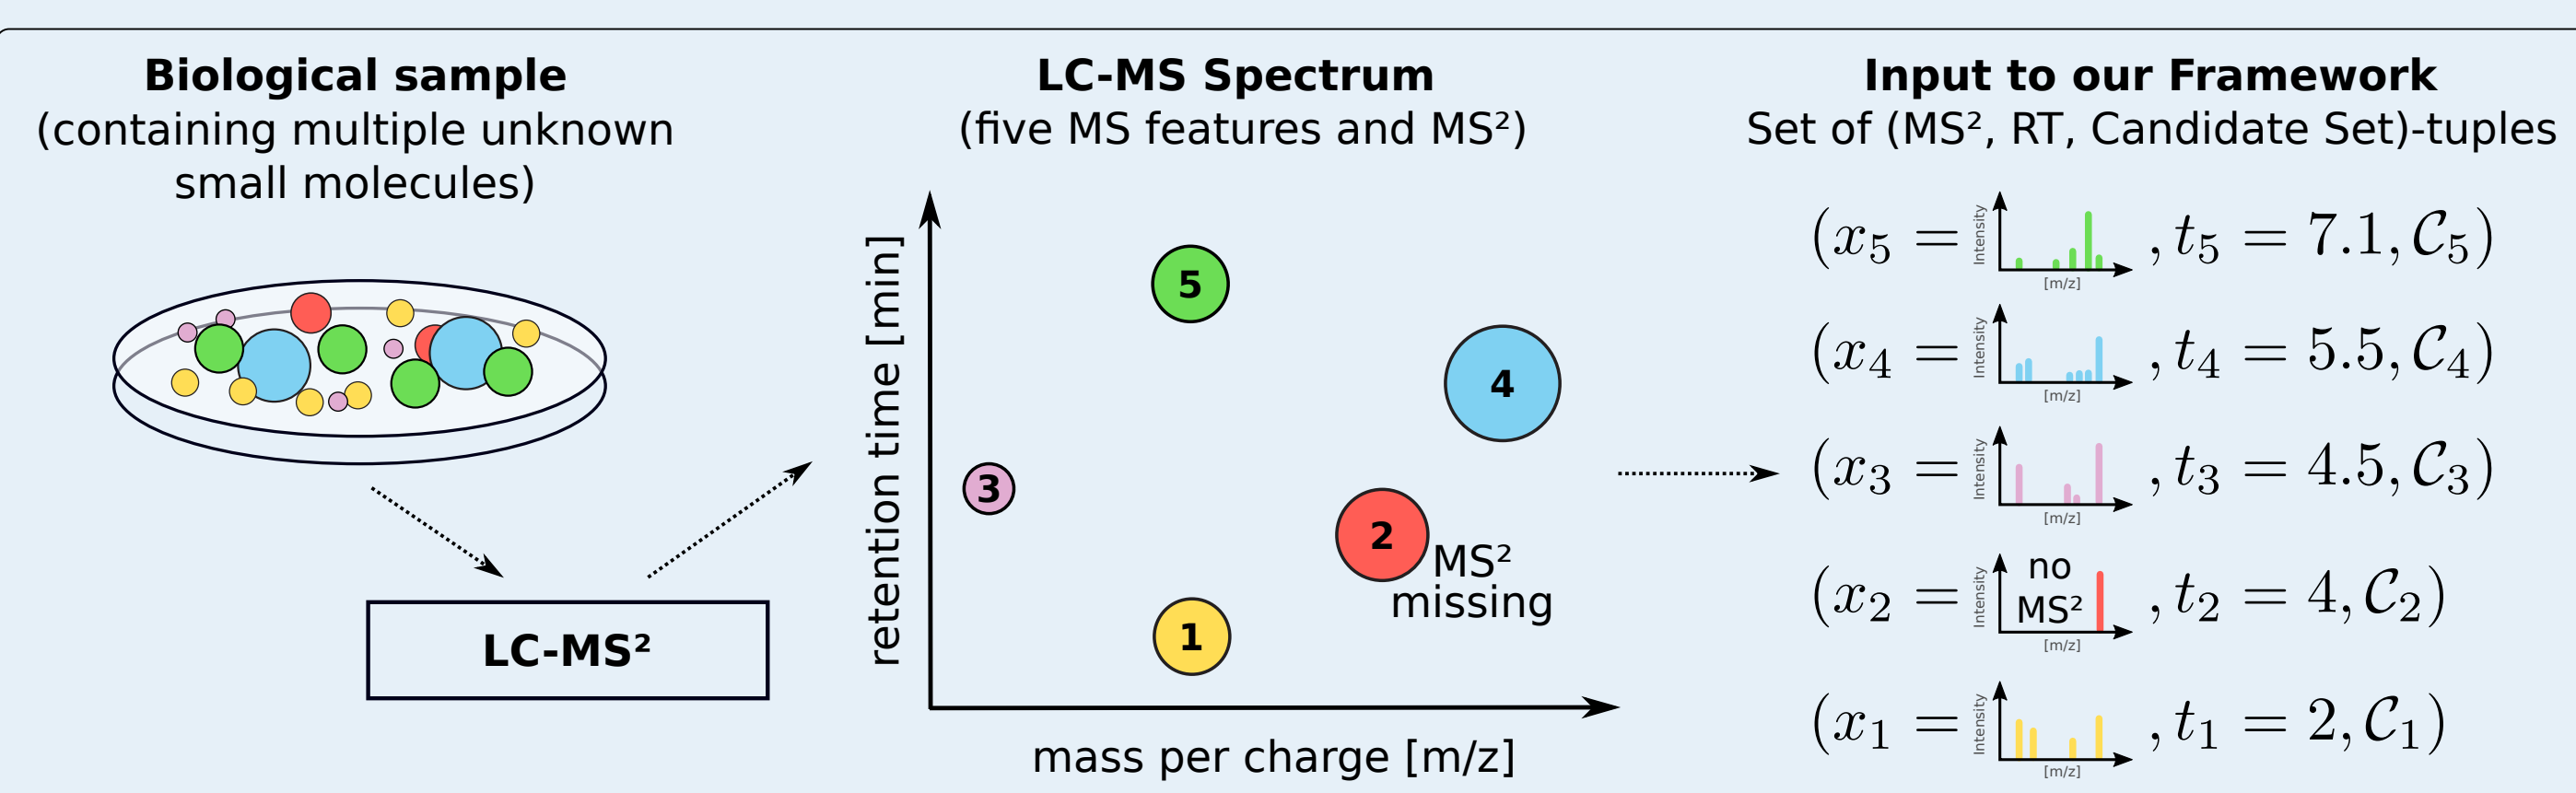

Fig. 1: LC-MS² analysis pipeline and resulting data used as input for our framework.

2. Retention Time (RT) Utilization for Small Molecule Identification

- Different approaches proposed in the literature
 - Multiple approaches to utilize RT for molecule annotation exist
 - (utilization of RT information, scalable, cross laboratories (LC-systems), RT reference free)
- Compare measured RTs with in-house reference RTs
 - Compare measured RTs with projected reference RTs
 - Compare measured RTs with predicted RTs
 - Compare measured RTs with predicted RTs proxies, e.g. LogP
 - Compare measured retention orders with predicted ones
- Fully supported: ✓, Partially supported: ●, Not supported: ✗
- RT comparison to prune candidate lists or (re)ranking [CITATION]

3. LC-MS² Experiment Data: Input and Output of our Framework

- Input:** Preprocessed LC-MS² data, i.e. after peak-picking and alignment (Fig.1):

$$\mathcal{D} = \{(x_i, t_i, C_i)\}_{i=1}^N$$

x_i : MS Information; MS² or MS¹ (precursor m/z), if no fragmentation available

t_i : Measured RT

C_i : Molecular candidate sets, e.g. molecular structures found in PubChem by exact mass search

N : Number of MS features

- Precomputed MS scoring assumed:** MS¹ deviation of candidate and precursor mass or MS² scores, e.g. by CSI:FingerID [3], MetFrag [5] or IOKR [2]
- Output:** Ranking of the molecular candidates in $m_{ir} \in C_i$ for each MS feature i
- Ranking based on MS and RT information

4. Probabilistic Framework to integrate MS and RT Information

- Graphical model** G superimposed on the LC-MS² data (Fig. 2)
- Let $G = (V, E)$ be complete graph with a **node** $i \in V$ for each MS feature, and an **edge** $(i, j) \in E$ for each feature pair
- Discrete random variable $z_i \in \mathcal{Z}_i = \{1, \dots, n_i\}$ associated with each node ($n_i = |C_i|$)
- Candidate annotation for the complete data $\mathbf{z} = \{z_i | i \in V\} \in \mathcal{Z}_1 \times \dots \times \mathcal{Z}_N = \mathcal{Z}$
- Intuitively: Random variable z_i denotes the candidate $m_{ir} \in C_i$ assigned to feature i .
- Pairwise **Markov Random Field** as probabilistic model [4]:

$$p(\mathbf{z}) = \frac{1}{Z} \prod_{i \in V} \psi_i(z_i) \prod_{(i,j) \in E} \psi_{ij}(z_i, z_j)$$

- Potential functions: $\psi_i(z_i)$ MS score and $\psi_{ij}(z_i, z_j)$ match of observed and **predicted retention order**
- Molecular **candidates ranked** based on max-marginals [4] (Fig. 2):

$$p_{\max}(z_i = r) = \max_{\{z' \in \mathcal{Z} | z'_i = r\}} p(\mathbf{z}')$$

- Intuitively: Maximum marginal probability of a candidate assignment with $z_i = r$.

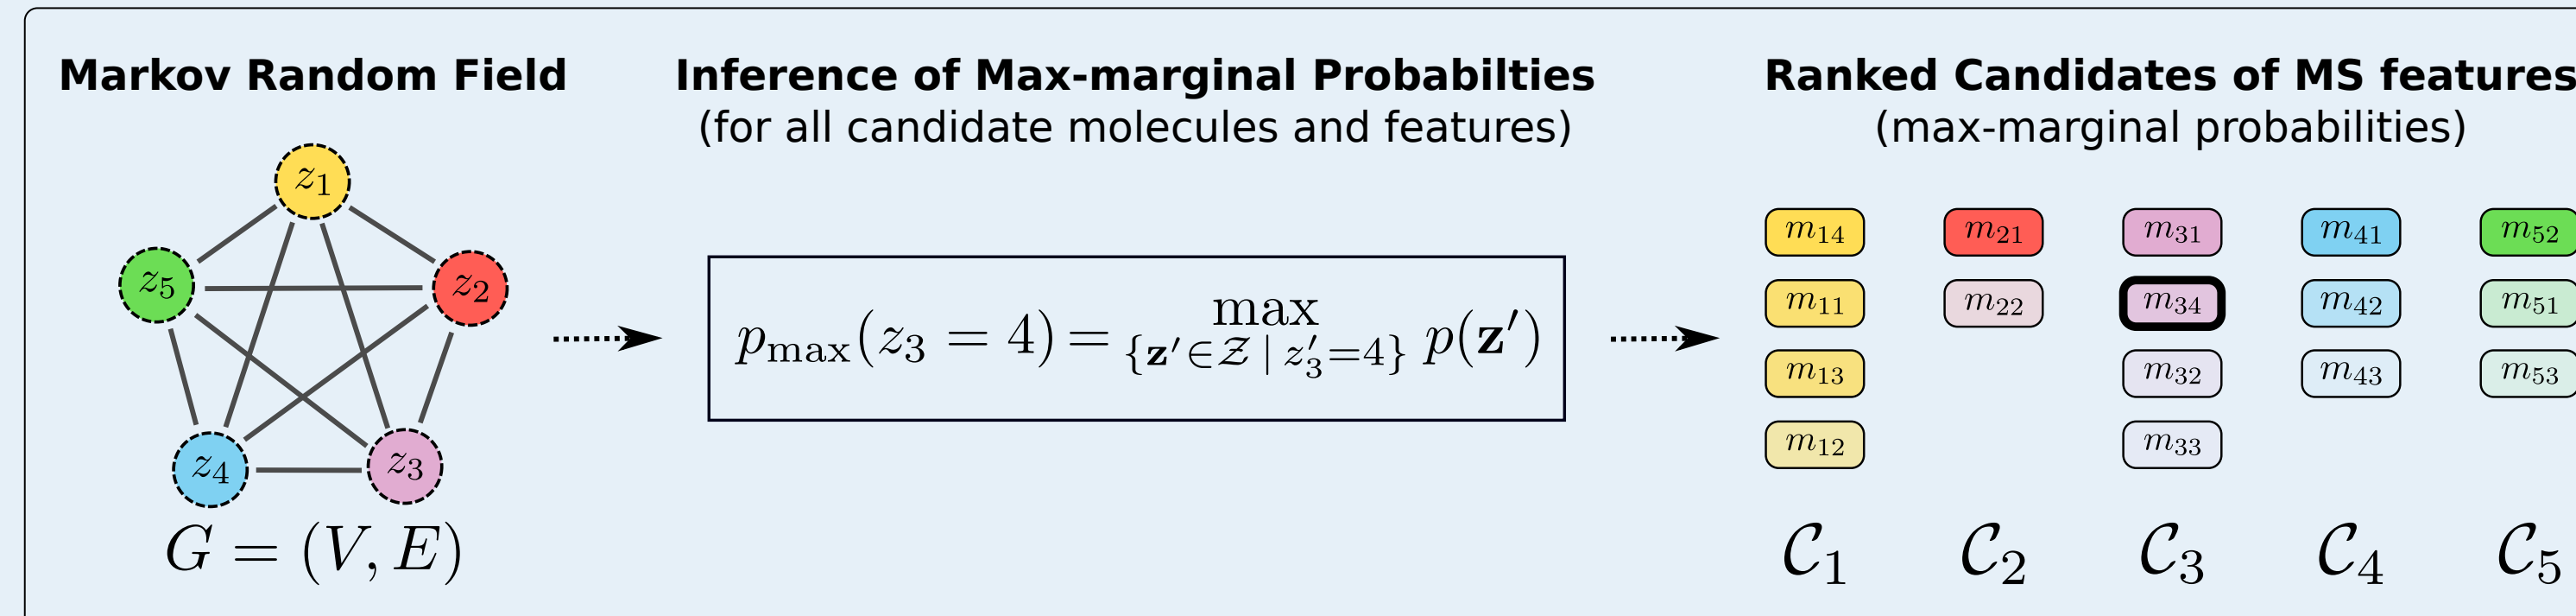

Fig. 2: MRF probability distribution and candidate ranking, e.g. MS feature $i = 3$ and candidate 4 (m_{34}).

5. Encoding MS and Retention Order Information: ψ_i and ψ_{ij}

- Node potential $\psi_i : \mathcal{Z}_i \rightarrow \mathbb{R}_{>0}$: $\psi_i(z_i = r) = f(x_i, m_{ir})$
- f returns the MS matching score $\in (0, 1]$ of spectrum x_i and candidate m_{ir}
- Edge potential $\psi_{ij} : \mathcal{Z}_i \times \mathcal{Z}_j \rightarrow \mathbb{R}_{>0}$, with σ being the sigmoid function:

$$\psi_{ij}(z_i = r, z_j = s) = \sigma(\underbrace{\text{sign}(t_i - t_j)}_{\text{observed retention order}} \cdot \underbrace{\langle \mathbf{w}, \phi(m_{ir}) - \phi(m_{js}) \rangle}_{\text{predicted retention order}})$$

- Intuitively: Matching observed and predicted retention orders receive high scores.
- Retention order prediction** using Ranking Support Vector Machine (RankSVM) w [1]
- Candidate molecules m_{ir} representation using non-linear features ϕ

Fig. 3: Example: Node and edge score for all candidate pairs of feature $i = 4$ and $j = 5$.

7. Experiments and Results

- Evaluation datasets:** CASMI 2016 [?], EA subset from MassBank used by [5]
- 681 (MS², RT)-tuples with median number of candidates between 120 and 919
- RankSVM training data:** 1248 RTs from PredRed [6] and CASMI 2016 training
- No evaluation set molecule in RankSVM training set
- Performance measure:** Top- k accuracy, percentage of correct molecular candidates at rank $\leq k$

Experiment 1: Comparison to MetFrag + LogP Prediction

- MetFrag relaunched [5]: Prediction of LogP values for candidates, linear model mapping measured RTs to LogPs, candidate re-ranking based on LogP deviation

Method	Top-1	Top-5	Top-10	Top-20
MS ² + RT (Our)	21.3	52.9	64.0	74.3
MS ² + RT (MetFrag & LogP)	20.5	49.1	61.2	72.6
Only MS ² (baseline)	16.7	49.5	60.4	70.6

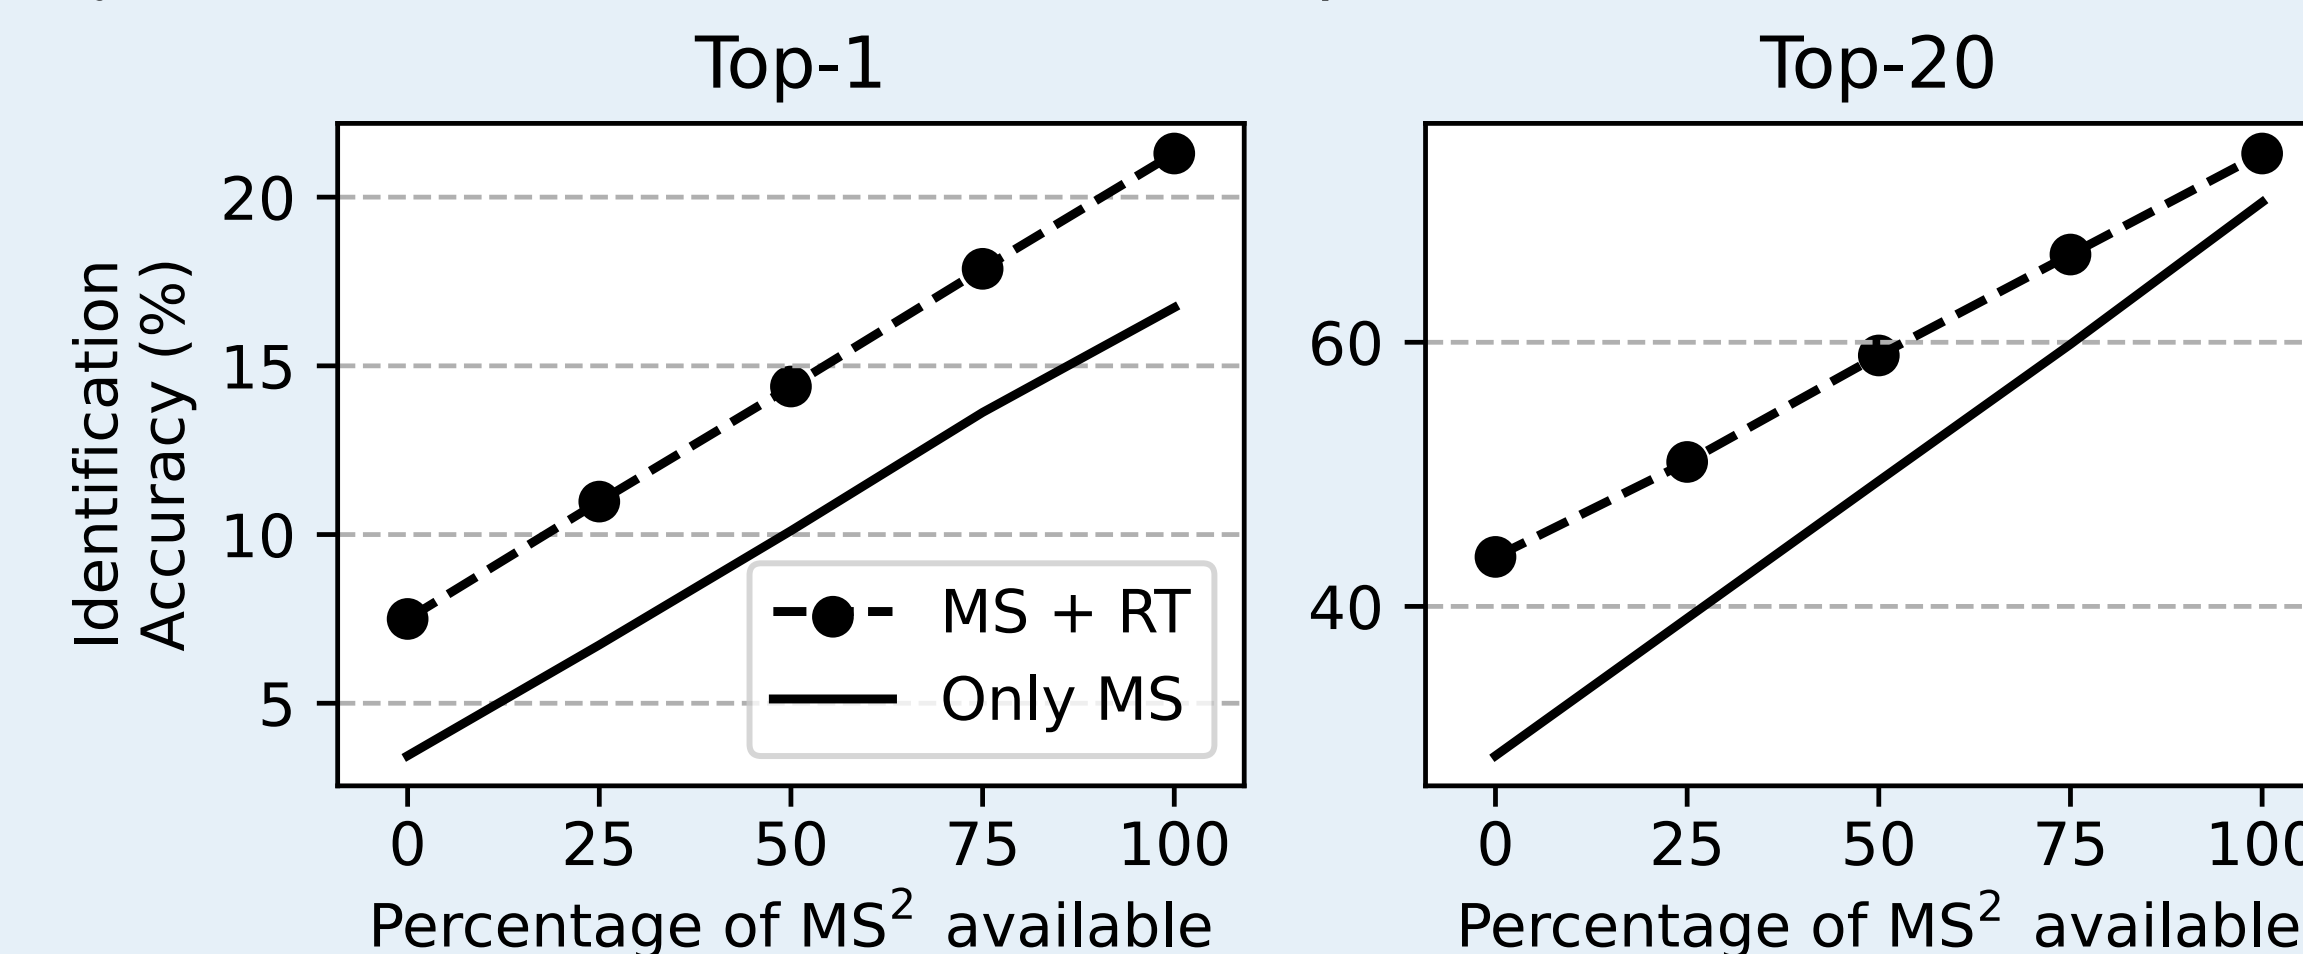

Experiment 2: Performance with different MS²-Scoring Methods

- MetFrag (in-silico fragmenter scores) and IOKR [2] as MS²-scoring methods

MS ² -Scorer	Method	Top-1	Top-5	Top-10	Top-20
MetFrag	MS ² + RT (our)	21.3	52.9	64.0	74.3
	Only MS ² (baseline)	16.7	49.5	60.4	70.6
IOKR	MS ² + RT (our)	26.7	52.1	62.5	70.3
	Only MS ² (baseline)	25.1	49.5	60.3	67.6

Experiment 3: Missing MS² Spectra

- Simulating missing MS² information: Varying from 0% (MS²) to 100%
- If only MS¹: Use mass deviation between precursor and candidate molecule
